

WORLD AIDS DAY, 25 YEARS LATER: WHAT HAVE WE LEARNED?

We've made significant global progress, but a one-size-fits-all approach to tackling AIDS on the African continent does not make sense.

THEN:

HIV/AIDS CASES DRAMATICALLY UNDERREPORTED

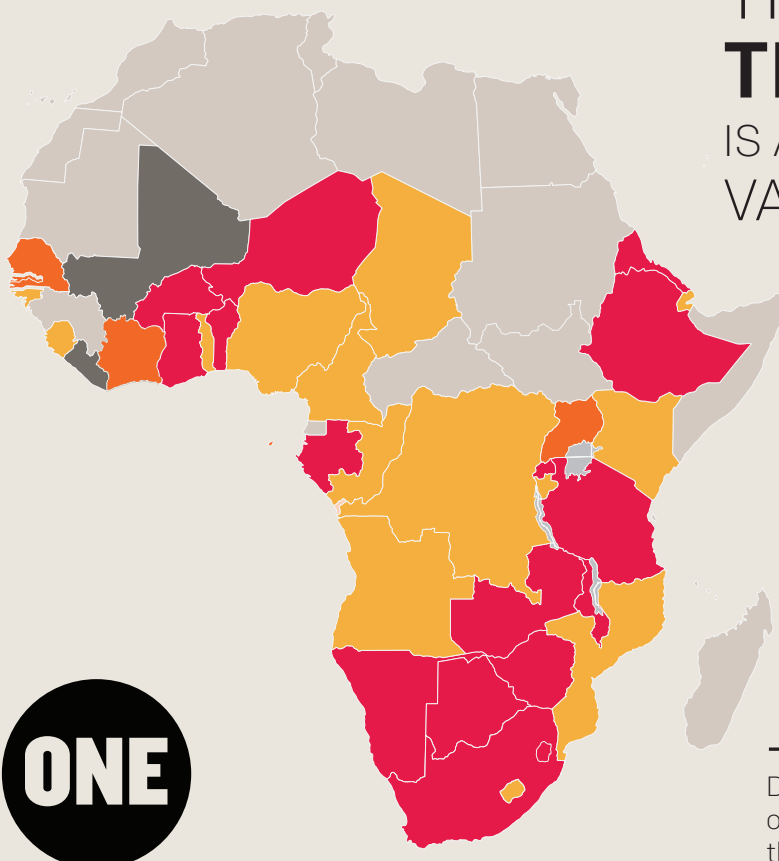

MYSTERIOUS, GLOBAL KILLER

MISUNDERSTOOD AND HIGHLY STIGMATIZED

TREATMENT HARD TO ACCESS AND VERY EXPENSIVE

NOW:

THE BEGINNING OF
THE END OF AIDS
IS ACHIEVABLE, BUT PROGRESS
VARIES ACROSS AFRICA

- 16** Reached the Tipping Point
- 5** Close to the Tipping Point
- 14** Acceleration Needed
- 2** Progress Reversed

-----> "The Tipping Point"

Defined as the moment when the total number of **people newly infected is equal to or less** than the number of people **newly added to treatment**.

WWW.ONE.ORG/AIDSREPORT

JUST HOW DIFFERENT IS PROGRESS?

LET'S COMPARE TWO COUNTRIES

Cameroon
(21.7m)

Ghana
(25.3m)

NUMBER OF PEOPLE
LIVING WITH HIV

= 100,000 people

PREVENTION OF
MOTHER-TO-CHILD
TRANSMISSION
COVERAGE RATE

8.5%

12%

PERCENT OF
NATIONAL BUDGET
SPENT ON HEALTH

NUMBER OF AIDS DEATHS
34,561 vs **11,625**

Achieving the beginning of the end of AIDS is not a foregone conclusion. We must accelerate progress, working country by country to ensure that treatment and prevention services reach all populations in need.
